

New fire dampers from Aldes

Aldes Middle East has launched its Istone fire damper range to enhance the level of safety, indoor air quality and thermal comfort in UAE buildings.

The dampers adhere to stringent European standards EN 1366-2 and ensure two hours' fire resistance without any heat transfer and smoke leakage.

These fire compartmentation solutions offer four main advantages according to the company: Firstly; no heat transfer as the damper is constructed with an efficient isolating blade of refractory material (calcium silicate). Secondly; no smoke leakage due to an intumescent fire seal, thirdly; quick activation that doesn't consume power and lastly; easy maintenance. The control box can be supplied with a reset motor for remote maintenance and inspection purposes.

The UAE-based company moved into its new factory at the beginning of the year, the new base features an 8000m² production site housing around 90 staff.
